

pdfFactory

pdfFactory is the solution to the growing need to produce universally readable future-proof documents simply, reliably and from any software.

pdfFactory creates PDF format documents as easily as printing them. It includes the ISO agreed PDF/A format and has valuable features not found in competing software, made possible because it has a preview screen. The preview allows you to re-order pages, revise bookmarks and add overlays etc.

Easy overlay creation You can create overlays such as letterheads by simply sending the original document to pdfFactory from whatever software you used to create it. You then save the page as an overlay rather than saving it as a PDF. The overlays are stored and can be applied to any subsequent PDFs.

You can add as many documents as you wish to the open preview window before turning them into a single PDF. The documents can be from different sources – word processors, spreadsheets, drawing programs etc. You can change the order of these jobs and add blank pages between them.

URL and other hypertext links are automatically recognized. The preview confirms that they will be recognized in the final PDF.

Bookmarking is simple and flexible. Bookmarks can be created automatically based upon the document's fonts and headings. The preview means that you can review the automatically created bookmarks and edit them as you would text in any document.

Restrict opening, copying or printing Flexible security is provided with 128 bit encryption. Restrictions can be tailored to the PDF's audience.

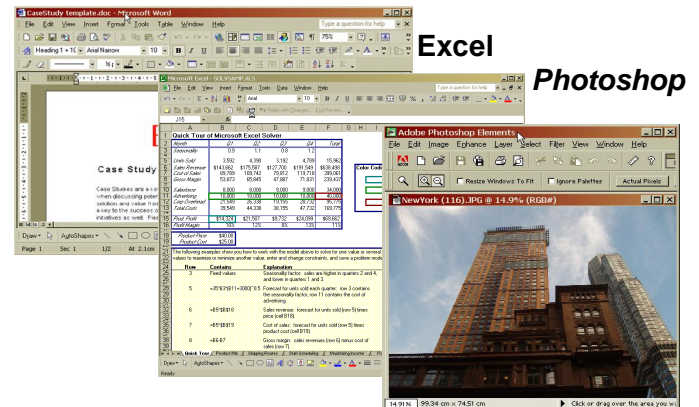

Watermarks, stamps, page numbering A set of variables is provided to automatically page number the PDF pages or type text onto the PDF pages.

“Where pdfFactoryPro truly excels, though, is in accuracy. Whatever you want to convert, including documents with tables, colour graphs or complex layouts, it does with the minimum of fuss. And that, ultimately, is why it wins a Recommended award.”

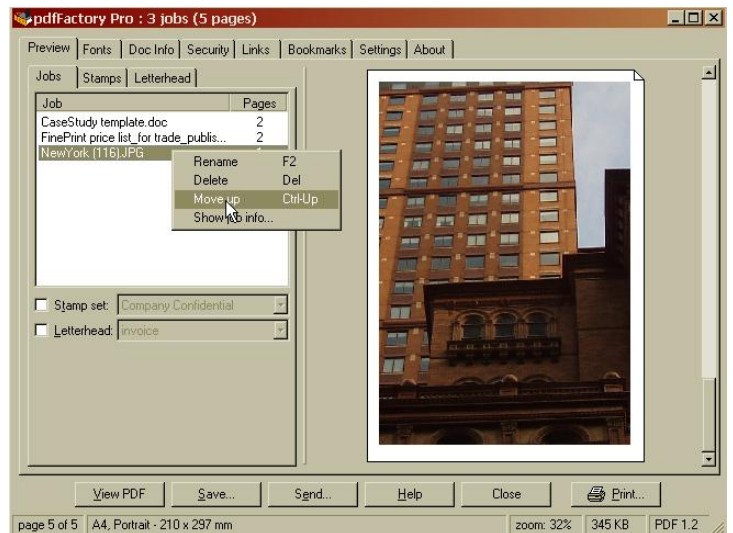

Davey Winder, PCPro magazine.

Combine many documents into one PDF

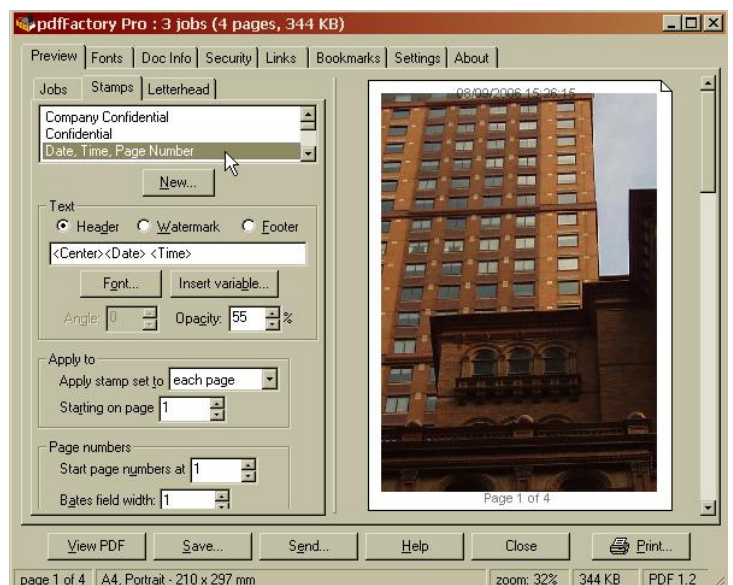

Word

Change the job or page order in the preview. Remove jobs or pages for specific recipients

Add watermarks, page numbers or an overlay such as a logo or letterhead

FinePrint 6

One simple control interface to get the most out of all your printers and save paper, preprinted stationery and ink.

FinePrint is a print management tool which functions as an advanced printer driver. It provides the features found in the better drivers provided by printer manufacturers, but has the advantage **that this single interface will control all of the diverse printers in the business.** Only one intuitive interface needs to be learnt.

A straightforward multi-up and booklet feature that can be used with any original document on any printer (even non duplex). FinePrint can save paper, toner, storage and postage. We have halved our paper consumption and our customers have reported similar savings.

Simple application of **overlays** saves preprinted stationery costs. FinePrint prevents scrapped work because preprinted stationery was or was not in the expected tray. Document control is improved through a wide range of variables that make it easy to add page numbering, date/time, printer origin etc. to the document as it is printed.

Jobs can be combined simplifying the production of reports drawn from different sources such as word processors, spread sheets, graphics programs etc.

Appearance can be enhanced by selecting appropriate margins and gutters for binding etc.

Difficult jobs can be printed more easily by using FinePrint. Paper scaling allows **documents such as web pages to be captured to a large paper size such as A3 or A4 plus and reduced to A4 when printed.** A simple check box system allows you to turn all text black for greater readability or to remove graphics to speed up printing or save toner.

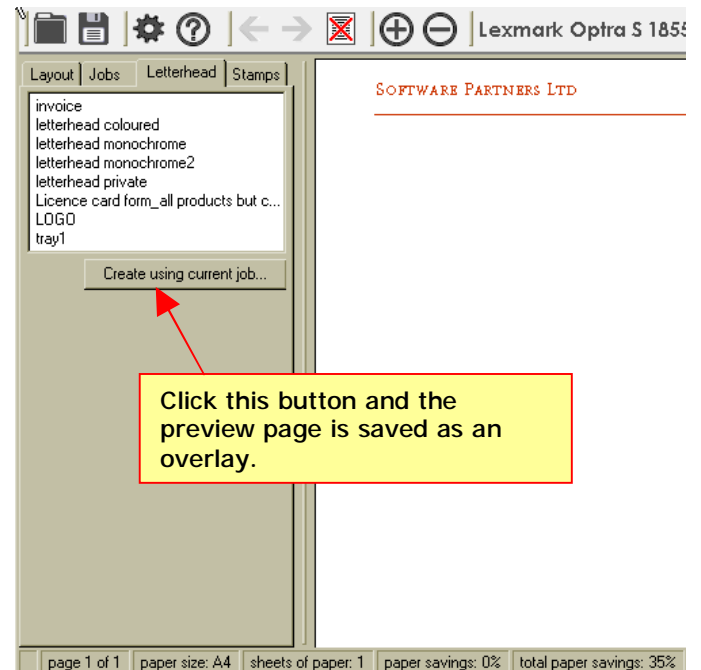

Large corporate users can simplify printing by removing non relevant printers from those that staff see, and giving printers on the available list meaningful nicknames. Most of the printing and layout options can be shown or hidden through a checkbox style options table.

We have more than halved our paper consumption and so have many of our customers. A log on the status bar along the bottom of the FinePrint window records paper consumed against page images printed.

"FinePrint is so good it begs a printer manufacturer to snap it up and use it as the front end of their driver. If we could give it more than six stars, we would."

Davey Winder, PCPro magazine.

Send the page to FinePrint from the program you created the overlay in and save it as an overlay.

Once you have sent the document(s) to FinePrint you can select format changes from a simple interface.
